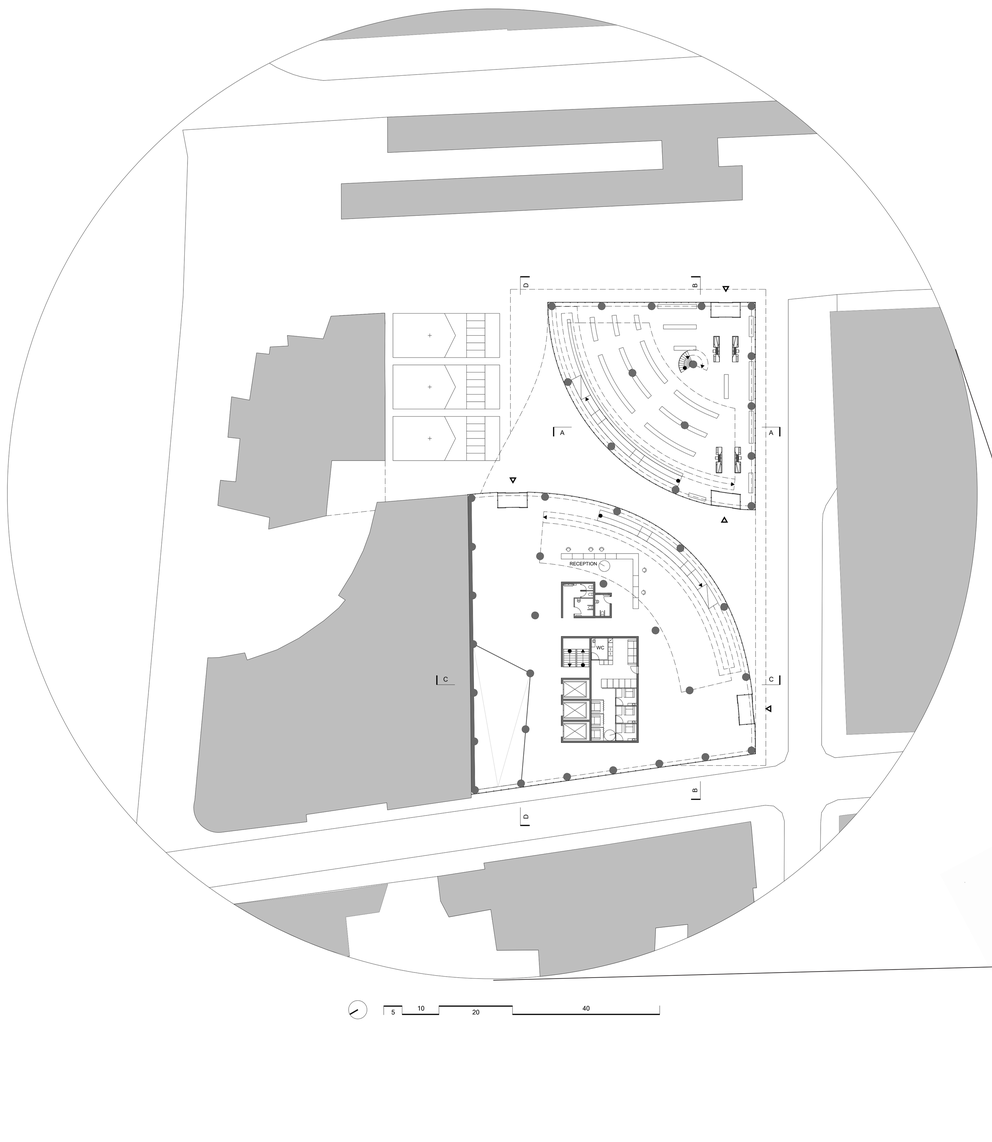
Ground Floor Plan 1:250



The Paralympic games first saw their modern form in 1960, following the Olympic games in Rome. The first Paralympics had ~400 participants while the 2020 edition had 4403. Out of that last number 61 were Colombians, making up 1.39% of the competitors. That is more than twice the percentage of Colombian participants in the 2020 Olympic games which was 0.61%, 70 out of 11420. Quite clearly there is a large pool of talent for Paralympic sports in Colombia. What is lacking is the public interest and facilities. That is where our paralympic sport center comes into the picture.

For obvious reasons the entire building is designed with accessibility in mind, no matter the disability. The idea is that the building should be equally accessible for a vision impaired, movement impaired, non-impaired etc. There are various ways in which the building works to make that possible. One of the base principals is to keep all transport spaces wide enough so that for example a wheelchair can turn around. It is also important that all functions either are adapted to that or that are adapted options somewhere in the building. For example every changing room has extra large shower stalls and there are extra large bathrooms on every floor. Another example that is meant to help the vision impaired is how the building works with black floors and white walls, maximizing the contrast and helping with navigation. As for the fully blind there are railing installed along all walls. The building also has a fire exit ramp running through all the floors as well as a stairwell and three extra large elevators stopping at every floor. As the different sports in the building are directed towards different disabilities, so are the courts. For example the blind football and goalball, which are played by vision impaired (or non-impaired wearing blinding goggles) are required to be played in silence since the participants need to hear the ball (which has a bell in it to help locate it). Therefore these courts are screened off with sound proof walls from the other courts. Another example is the sitting volleyball which has added heating under the floor for comfort.

One of the great things about designing an accessible building is that the design is enabling for everyone. The extra space can be used to great advantage with strollers just as well as the wheel chairs. It also gives more space to avoid potentially uncomfortable meetings in corridors and such spaces. With the same idea in mind both the interiors and exteriors in the buildings nearest proximity are well lit by night time, showing what's ahead and leaving no surprises. Having the building's bottom floors be glassed also gives an "eye on the street" as the bottom floors are manned at all hours. The outdoor walkway running under the building which could have otherwise been a scary path to travel is now instead safer than most. In order to appeal to as many people as possible there are a number of different bathrooms and changing rooms. There are gender neutral ones as well as womens and mens. There are also smaller family changing rooms (these contain both shower, bathroom and changing area.) All the family changing rooms and all the larger accessible bathrooms also contain a changing table. The second floor has a lactation room with both private stalls and more open ones as well as a bathroom, microwaves, a pentry with fridge, a couch to wait in and stroller parking spaces. As for the courts, most of them follow the same standards regardless of gender. An example would be the basketball court which needs a different hoop height for women and men. Simply solved by having adjustable hoops.
